USER MANUAL STEAM WAX MELTER

Techtron Steam wax melter is completely made of antimagnetic stainless steel INOX 304. Thickness of the material is 1mm. One melting cycle can hold about 10-15 DB whole frames depending on the size.

Instruction manual:

-Put the frames in the strainer, and put the strainer inside the wax melter.

-Close the lid and secure it with buckles.

-Pour water inside the wax melter, until the water level reached the half level of the reservoir on the side. The heating elements inside must be covered in water.

NOTE: During the process the reservoir must never be empty. (the heaters inside the wax melter will burn!)

-The equipment should be plugged in directly to the electrical socket (if an extension lead is to be used, it must be made from an adequate size electrical cable) This product uses 2 x 1.5kW heating elements (3kW in total) and there must not be any other equipment plugged in to the same electrical power circuit as it would overload the circuit.

-After completing all the instructions, turn on the heaters with the switches at the back of the equipment.

-First melting cycle should last between 60 and 90 min (depending on the outer temperature and the amount of melting wax inside the melter). Use both heaters for the initial start and once the desired temperature has been achieved it is possible to turn one heater off to maintain the operation at the right temperature. Time of the next melting cycles is between 15 and 30 min.

-The wax melter measurements are 73cm x 83cm and 60cm height. This is measured from the end of the outlet to the electronic component at the back of the melter and the water tank to the side of the melter.
